

MEDIUM AND LOW FREQUENCY ELECTRO-STIMULATED MASSAGING PANTS

BACKGROUND OF THE INVENTION

(a) Field of the Invention

5 The present invention relates to medium and low frequency
electro-stimulated massaging devices, and more particularly to a
pair of medium and low frequency electro-stimulated massaging
pants, which is provided with a clustered conductive button set
for mounting an electro-stimulating controller thereon so as to
10 achieve the effect of massage or fat reduction.

(b) Description of the Prior Art:

 The devices for medium and low frequency wave massaging in
the prior art are mainly composed of a controller and electrodes
made of silica gel (or conducting gel or electrode cups made of
15 silica gel). Those devices are disadvantageous in high production
cost and low electrical conductivity and can only be applied in
special occasions. Especially, silica gel must be smeared over
body portions the electro-stimulated massage is applied to, which
inevitably causes discomfort and cleansing problem to a user.
20 Furthermore, silica-gel plates and silica-gel cups are both hard
objects, which are heavy and uncomfortable to wear, substantially
reducing the portability thereof.

SUMMARY OF THE INVENTION

 The primary objective of the present invention is to provide a

pair of medium and low frequency electro-stimulated massaging pants having a plurality of conductive strips, which are made of electrically conductive cloths. Each of the conductive strips has a first end connected with a conductive plate and a second end
5 connected with a conductive button. The conductive plates are in direct contact with the human body when the pants are put on. The conductive buttons are clustered on a predetermined location of the pants, which can be coupled with a corresponding set of conductive buttons on an electro-stimulating controller so as to
10 mount the controller onto the pants. The electro-stimulating controller charges the conductive plates to provide the effect of a medium and low frequency electro-stimulated massage, which may actuate a rehabilitating exercise, promote blood circulation and induce fat reduction.

15 The various objects and advantages of the present invention will be more readily understood from the following detailed description when read in conjunction with the appended drawings.

BRIEF DESCRIPTION OF THE DRAWINGS

10 **DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS**

Referring to Fig.1 and Fig.2, a pair of medium and low frequency electro-stimulated massaging pants according to the present invention is basically a pair of pants 10 having a plurality of conductive strips 1 attached on selective locations thereon. The
15 conductive strips 1 are installed along an elastic band 101 and/or on other predetermined locations of the pants 10. Each of the conductive strips 1 has a first end connected with a conductive plate 11 and a second end connected with a conductive button 12. The conductive buttons 12 are clustered on a pre-determined
20 location of the pants 10, which can be coupled with a corresponding set of conductive buttons 23 on an electro-stimulating controller 2 so as to mount the controller 2 onto the pants 10, as shown in Fig.2. The electro-stimulating controller 2 charges the conductive plates 11, which are in direct
25 contact with the human body when the pants 10 are put thereon, to produce the effect of an medium and low frequency

electro-stimulated massage.

Referring to Fig.3 to Fig.7, the electro-stimulating controller 2 is provided with a central integrated circuit (IC) and a charging/discharging circuit. The IC transports a pulsed-wave signal to the circuit for controlling the charging/discharging of the capacitors and inductors thereon from which a high voltage is generated for providing an electro-stimulating effect. The IC further adjusts the bandwidth of the pulsed-wave signal, in a range from 1Hz to 150 Hz, to produce massaging effect of various strengths. Furthermore, the electro-stimulating controller 2 has a plurality of control buttons 21 for respectively selecting current up/down, operation time, power on/off and massage mode. The electro-stimulating controller 2 further contains an LCD display for displaying the operation status. The pulsed high voltage generated by the internal circuit (as shown in Fig.5 and Fig.6) is connected to a plurality of conductive buttons 23, which then form an output terminal. A stepping switch 24 is installed on a lateral side of the electro-stimulating controller 2 for selecting the charging region.

Referring to Fig.8, each of the above-mentioned conductive strips 1 is secured in the elastic band 101 of the pants 10 and has the second end connected to a conductive button 12, which consists of a female piece 12a and a male piece 12b, respectively attached on each side of the elastic band 101. As the female piece 12a and the male piece 12b are being rivet-connected, the associated conductive strip 1 is secured within the elastic band 101, whereas the female piece 12a extends outside the pants 10,

providing a connection to a conductive button 23 on the electro-stimulating controller 2, as shown in Fig.2 or Fig.5.

Referring to Fig.9, the conductive strips 1 of the present invention can each be connected with more conductive plates 11. 5 The conductive strips 1 are arranged either in parallel separated by a proper spacing or in an overlapped fashion and insulated by an insulating material 13, as shown in Fig.9. The inducing terminal 14 of a conductive strip 1 is extended out of the elastic band 101 for touching a conductive plate 11 as the plate 11 is sewn 10 on to the pants 10.

As shown in Fig.10, another preferred embodiment of the present invention has a different means of connecting a conductive plate 11 and the inducing terminal 14 of a conductive strip 1. The inducing terminal 14 is provided with at least one 15 conductive button 141, and the conductive plate is provided with at least one corresponding conductive button 111. The conductive plate 11 is mounted onto the inducing terminal 14 by riveting the conductive button 111 and the conductive button 141 together, which makes the conductive plate 11 detachable.

20 As shown in Fig.14, another preferred embodiment of the present invention has an inducing terminal 14 that is provided with an adhesive patch 142 and a conductive plate 11 that is provided with a corresponding adhesive patch 112. The conductive plate 11 is mounted onto the inducing terminal 14 by 25 sticking the adhesive patch 112 and the adhesive patch 142 together.

As shown in Fig.12 and Fig.13, another preferred embodiment

of the present invention has a plurality of conductive strips 1 sewn into the elastic band 101 and having the same wrinkled form as the elastic band 101.

The pants 10 according to the present invention need not to
5 have a fixed form. It can be selected from male underpants, female underpants, outer pants and toreador pants. The preferred embodiment shown in Fig.14 is the present invention applied to a pair of toreador pants, whereas the preferred embodiment shown in Fig.15 is the present invention applied to a pair of ordinary
10 underpants. When embodied in toreador pants or other tight underpants, more conductive plates can be added on locations corresponding to other body portions, which are connected to conductive strips 1 extended from the elastic band 101.

Referring to Fig.16, the medium and low frequency
15 electro-stimulated massaging pants according to the present invention may have the electro-stimulating controller 2 separable from the pants 10. A set of wires 15 is used to connect the conductive buttons 12 of the pants 10. The free end of the wire set 15, extending from a pocket 17, is provided with a set of
20 conductive buttons 16. The conductive buttons 16 are capable of being coupled with the conductive buttons 23 on the electro-stimulating controller 2 so that the electro-stimulating controller 2 can be put in the pocket 17.

The above-mentioned pants 10, taking the forms of toreador
25 pants or tight underpants, have closer contact with the human body, and therefore may have conductive strips 1 and conductive plates 11 deployed on various locations of the pants. Referring to

Fig. 17 to Fig.20, a variety of such preferred embodiments have
conductive plates 11 connected in series or in parallel by a
plurality of conductive strips 1 and installed on locations on the
inner surface of the pants, which correspond to acupuncture
5 points or fat-accumulating places. Alternatively, a selected place
where a conductive strip 1 extends can be provided with a
conductive button 141 for mounting a conductive plate 11 when an
electro-stimulated massage is designated to the place. In addition
to the effects of promoting circulation and fat reduction, the
10 electro-stimulated massage applied to some sensitive body
portions would produce a sexually provoking effect.

Referring to Fig.20, a plurality of elastic bands 19 are added
on one or two lateral sides of the pants 10 for accommodating
users of various sizes.

15 Referring to Fig.21, the above-mentioned conductive buttons
141 on the pants 10 are each covered by a cloth cover 18 formed
by two overlapped pieces, and the conductive buttons 141 are
thereby electrically insulated. To use a conductive button 141,
two pieces of a cloth cover 4 are pushed aside to enable a
20 connection with a conductive plate 11 of a conductive strip 1. The
cloth cover 18 can also be of one piece, which is lifted when the
conductive button 141 underneath is to be used.

The conductive strips 1 of the present invention are made of
ordinary electro-conductive materials, and preferably soft
25 electro-conductive cloths.

Although the present invention has been described with
reference to the preferred embodiments, it will be understood that

the invention is not limited to the details described thereof. Various substitutions and modifications have been suggested in the foregoing description, and others will occur to those of ordinary skill in the art. Therefore, all such substitutions and
5 modifications are intended to be embraced within the scope of the invention as defined in the appended claims.
